

DEPLOYMENT & STORAGE MANUAL: NETLIFY + GITH

A quick setup guide to host your custom PDF Shelf website on Netlify

1. PROJECT REQUIREMENTS:

This application compiled via Vite provides entirely static production assets in the 'dist/' directory, making it 100% compatible with modern static hosters (Netlify, Vercel, GH Pages).

2. STORING YOUR OWN FILES:

Simply place any PDF file you want in the '/public/' folder of your source directory. For example, save a file as 'public/my-file.pdf'. Once deployed, it can be viewed at `yourwebsite.com/my-file.pdf`. Add its metadata to the library catalog in the UI configs.

3. GIT & GITHUB LINKING CONFIGURATIONS:

- Initialize your git repository locally: `git init`
- Add your local files and commit: `git add . && git commit -m "feat: first commit"`
- Add your remote GitHub repo: `git remote add origin https://github.com/USERNAME/REPO`
- Push your codebase: `git push -u origin main`

4. NETLIFY 1-CLICK DEPLOYMENT:

- Sign in to Netlify, and click "Add new site" -> "Import from an existing project".
- Authenticate and select your GitHub repository.
- Configure the Build Settings:
 - * Build Command: `npm run build`
 - * Publish Directory: `dist`
- Click "Deploy site". Enjoy your automated CI/CD! Every push redeploys automatically.
